DESCRIPTION:

The 5T9050 2.5V single data rate (SDR) clock buffer is a single-ended input to five single-ended outputs buffer built on advanced metal CMOS technology. The SDR clock buffer fanout from a single input to five single-ended outputs reduces the loading on the preceding driver and provides an efficient clock distribution network. Multiple power and grounds reduce noise.

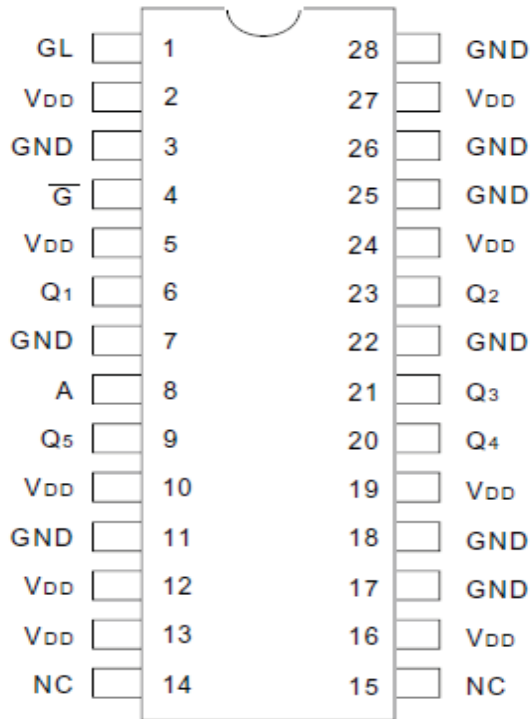

APPLICATIONS:

- Clock and signal distribution

V _{DD}	Power Supply Voltage	-0.5 to +3.6	V
V _I	Input Voltage	-0.5 to +3.6	V
V _O	Output Voltage	-0.5 to V _{DD} +0.5	V

NOTE:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

PIN DESCRIPTION

Symbol	I/O	Type	Description
A	I	LVTTL	Clock input
\bar{G}	I	LVTTL	Gate control for Qn outputs. When \bar{G} is LOW, these outputs are enabled. When \bar{G} is HIGH, these outputs are asynchronously disabled to the level designated by GL ⁽¹⁾ .
GL	I	LVTTL	Specifies output disable level. If HIGH, the outputs disable HIGH. If LOW, the outputs disable LOW.
Qn	O	LVTTL	Clock outputs
V _{DD}		PWR	Power supply for the device core, inputs, and outputs
GND		PWR	Power supply return for power

NOTE:

- Because the gate controls are asynchronous, runt pulses are possible. It is the user's responsibility to either time the gate control signals to minimize the possibility of runt pulses or be able to tolerate them in down stream circuitry.

NOTES:

1. Skew measured between all outputs under identical input and output transitions and load conditions on any one device.
2. Skew measured is the difference between propagation delay times t_{PHL} and t_{PLH} of any output under identical input and output transitions and load conditions on any one device.
3. Skew measured is the magnitude of the difference in propagation times between any outputs of two devices, given identical transitions and load conditions at identical V_{DD} levels and temperature.
4. Guaranteed by design.

AC TIMING WAVEFORMS

Propagation and Skew Waveforms

NOTE: Pulse Skew is calculated using the following expression:

$$t_{SK(P)} = |t_{PHL} - t_{PLH}|$$

where t_{PHL} and t_{PLH} are measured on the controlled edges of any one output from rising and falling edges of a single pulse. Please note that the t_{PHL} and t_{PLH} shown are not valid measurements for this calculation because they are not taken from the same pulse.

Gate Disable/Enable Showing Runt Pulse Generation

NOTE:

As shown, it is possible to generate runt pulses on gate disable and enable of the outputs. It is the user's responsibility to time their \bar{G} signal to avoid this problem.
